GOBLE

Serial No. 10/036,500

36. (Canceled)

37. (Previously Presented) A method of treating a tumour in a colon using an electrosurgical system comprising:

an electrosurgical generator adapted to generate a radio frequency oscillating voltage output across first and second output terminals;

an electrosurgical instrument having an active tissue treatment electrode

Serial No. 10/036,500

connected to the first generator output terminal;

fluid delivery means for delivering electrically-conductive fluid to the tumour to be treated; and

a return electrode connected to the second generator output terminal, the method comprising the steps of:

enclosing, in a substantially fluid-tight manner, a space in the colon within which the tumour to be treated is located, and within which at least the active electrode is located;

operating the fluid delivery means at least partly to fill the space with electrically-conductive fluid;

operating the generator to apply a radio frequency voltage between the active and return electrodes, and completing at least a part of a conduction path between the active and return electrodes using the electrically-conductive fluid; and manipulating the active electrode in the vicinity of the tumour to be treated; wherein the space is enclosed by means of a flexible enclosing member which forms a seal with a portion of the colon.

- 38. (Original) A method according to claim 37, wherein the method further comprises the step of reducing the pressure within the space to a level below air pressure in the immediate vicinity outside the space.
 - 39. (Previously presented) A method of treating a tumour in a colon using an

Serial No. 10/036,500

electrosurgical system comprising:

an electrosurgical generator adapted to generate a radio frequency oscillating voltage output across first and second output terminals;

an electrosurgical instrument having an active tissue treatment electrode connected to the first generator output terminal;

fluid delivery means for delivering electrically-conductive fluid to the tumour to be treated; and

a return electrode connected to the second generator output terminal, the method comprising the steps of:

enclosing, in a substantially fluid-tight manner, a space in the colon within which the tumour to be treated is located, and within which at least the active electrode is located;

operating the fluid delivery means at least partly to fill the space with electrically-conductive fluid;

operating the generator to apply a radio frequency voltage between the active and return electrodes, and completing at least a part of a conduction path between the active and return electrodes using the electrically-conductive fluid; and manipulating the active electrode in the vicinity of the tumour to be

mampalating the delive closured in the norm, or the tallier to be

treated;

wherein the space is enclosed by means of a flexible enclosing member which forms a seal with a portion of the colon; and

Serial No. 10/036,500

wherein the flexible enclosing member includes a proximal bung and a distal bung.

- 40. (Original) A method according to claim 39, including the further step of inflating the colon by delivering conductive fluid to the space through a first opening in the distal bung so that the tumour can be treated by the active electrode.
- 41. (Original) A method according to claim 40, including the further step of inserting into the space through the first opening an endoscope having a first channel for delivering the conductive fluid and a second channel for inserting the active electrode.
- 42. (Original) A method according to claim 40, including the further step of removing the conductive fluid from the space through a second opening in the proximal bung.
- 43. (Original) A method according to claim 37, wherein the flexible enclosing member is inserted endoscopically into the space through the colon's lumen.
- 44. (Previously presented) A method of treating a tumour in a colon using an electrosurgical system comprising:

an electrosurgical generator adapted to generate a radio frequency oscillating

voltage output across first and second output terminals;

an electrosurgical instrument having an active tissue treatment electrode connected to the first generator output terminal;

fluid delivery means for delivering electrically-conductive fluid to the tumour to be treated; and

a return electrode connected to the second generator output terminal, the method comprising the steps of:

enclosing, in a substantially fluid-tight manner, a space in the colon within which the tumour to be treated is located, and within which at least the active electrode is located;

operating the fluid delivery means at least partly to fill the space with electrically-conductive fluid, the space being enclosed by means of a flexible enclosing member which forms a seal with a portion of the colon;

operating the generator to apply a radio frequency voltage between the active and return electrodes, and completing at least a part of a conduction path between the active and return electrodes using the electrically-conductive fluid; and manipulating the active electrode in the vicinity of the tumour to be treated; and

laparoscopically inserting a flexible sleeve to thereby surround a region of the colon containing the tumour to be treated and apply a second pressure against a first pressure resulting from the filling of the space with the electrically-conductive fluid.

GOBLE

Serial No. 10/036,500

45. (Original) A method according to claim 44, wherein the flexible enclosing member includes a proximal bung and a distal bung and wherein the proximal and distal bungs form a pressure seal against both the colon and the pressure applied via the inflatable sleeve.

- 46. (Original) A method according to claim 44, wherein the active electrode is manipulated to remove the tumour and a region of the colon within which the tumour is located once the blood supply and lymphatics of the region have been disconnected.
- 47. (Original) A method according to claim 40, including the further step of inserting into the space through the first opening an endoscope having a fluid channel for delivering the conductive fluid and an instrument channel for inserting the active electrode.
